

SONAX

AIFi Agentic Finance Aggregation Platform

ECOSYSTEM WHITEPAPER / BUSINESS PLAN

AI AGENTS · ON-CHAIN ARBITRAGE · WEB3 FINANCIAL INFRASTRUCTURE

Aggregating On-Chain Opportunities. Powering Intelligent Execution.

AI Agents | Financial Execution | Quantitative Intelligence | Ecosystem Aggregation

OFFICIAL PUBLIC EDITION | OCTOBER 2026

CHAPTER 00

Business Overview

EXECUTIVE SUMMARY

SONAX is positioned as an AIFi agentic finance aggregation platform. Its multi-agent collaboration system orchestrates market data, strategy analysis, risk controls, asset allocation and on-chain settlement to create intelligent financial execution infrastructure for digital asset markets. The platform develops professional capabilities in on-chain price arbitrage, quantitative strategies, financial data and machine payments, while the XXX/SONAX dual-token model connects liquidity development, participation incentives and community collaboration.

Two Core Business Engines

Business Engine	Core Functions	Value Creation
AIFi Agentic Finance	Opportunity scanning, strategy orchestration, risk control, execution and audit	Realized net trading P&L; professional software and API revenue
XXX/SONAX Ecosystem Network	LP development, SONAX distribution, community tiers, FOMO and Syrup Pool	Token participation, liquidity organization and transparent rule execution

Core Commercial Proposition

SONAX uses intelligent agents to improve cross-market coordination, controlled execution to reduce trading errors and unnecessary costs, and programmable accounts with on-chain records to make transactions traceable. Ecosystem products enable users, strategy developers and enterprise clients to collaborate within one framework. Platform revenue comes from billable technology and financial services; SONAX token distributions follow separate protocol rules and are not conflated with company revenue or realized trading profits.

Intelligence × Execution × Trust

Intelligent decisions broaden market coverage; controlled execution improves fills; on-chain verification builds transparency.

CHAPTER 01

Industry Background & Market Structure

AGENTIC FINANCE × TOKENIZED ASSETS

Asset Markets Enter Programmable Collaboration

Digital asset trading now spans multiple blockchains, venues, liquidity pools and settlement protocols. Differences in price sources, executable depth, trading fees, market hours and account permissions create a constantly changing execution environment. Smart contracts, programmable wallets, real-time market APIs and stablecoin payments provide the technical foundation for automating financial workflows.

From Intelligent Understanding to Autonomous Execution

AIFi (Agentic Finance) combines language-model task comprehension, multi-agent collaboration, financial tool use and verifiable settlement. Agents collect data, analyze strategies, procure services and coordinate execution under explicit authorization; independent risk and trading systems strictly control funding rights, signatures, fills and settlement.

Four Persistent Market Challenges

Fragmented Price Discovery — Quotes span venues; executable depth and quote validity are hard to standardize.

Complex Trading Costs — Gas, venue fees, slippage, priority fees, funding and failed orders affect net results.

Disconnected Risk & Funds — Research, signing and execution use separate tools and accounts.

Weak Audit & Attribution — Orders, fees, user rights and platform charges lack unified reconciliation.

Market Advantage Comes from Realizable Net Execution

Price spreads alone are not profit: fills, costs, permissions and final settlement determine actual results.

CHAPTER 02

SONAX Positioning & Value Proposition

THE SONAX PROPOSITION

SONAX positions itself as an agentic finance aggregation platform, bringing together digital asset opportunities, professional execution tools, programmable accounts and ecosystem liquidity services. Standardized data, strategy workflows, risk reviews and trade audits provide participants with financial services that are understandable, actionable and verifiable.

Four Brand Principles

Principle	System Meaning	User Value
SENSE · Full Awareness	Monitor markets, on-chain liquidity and trading states	Broader market intelligence
THINK · Intelligent Coordination	Research, pricing, strategy and risk agents collaborate	More efficient opportunity screening
EXECUTE · Controlled Execution	Separate engine manages orders, permissions, limits and settlement	Stronger trading discipline
VERIFY · Transparent Verification	Record position changes, costs and realized net P&L	Auditable business data

Platform Audiences

The platform provides differentiated service access for digital asset users, quantitative researchers, Web3 projects, DAO treasuries, fintech providers and AI tool developers. Retail users value transparent, intuitive interfaces; professional teams prioritize data and execution quality; enterprise clients require authorized operations, service reliability and programmable APIs.

CHAPTER 03

Dual-Engine Ecosystem Architecture

BUSINESS ARCHITECTURE

Financial Execution Engine

The AIFi engine starts with market data and AI agents, processes strategy simulation, order routing, risk-controlled signing and on-chain confirmation, and verifies outcomes through actual fills and fee reconciliation. It supports market opportunity research, strategy technology services and institutional automation workflows.

XXX/SONAX Ecosystem Engine

The Alpha XXX project is the ecosystem asset gateway for the XXX/SONAX trading pair. SONAX is the incentive token. Together, liquidity participation, rule-based distribution, community tiers, the Syrup Pool and FOMO mechanisms form an on-chain interaction network. Its ongoing operation relies on smart contracts, user authorization, asset liquidity, reward budgets and operational policies.

How the Two Engines Work Together

Area	Financial Execution	Ecosystem Module
User Access	Trading terminal, data and risk services	Wallet, XXX/SONAX LP and community portal
Core Execution	Agent workflows, ordering and settlement	Staking, distributions, redemptions and token allocation
Public Records	Trading and fee data	Pool balances, rights and incentive flows
Value Retention	Billable professional services	Real liquidity demand and community retention

Business Separation: trading results, platform revenue and protocol distributions use separate accounts, with clear asset ownership and financial responsibilities.

CHAPTER 04

Products & Service Use Cases

PRODUCT ECOSYSTEM

Product	Role	Core Capabilities
SONAX RADAR	On-chain opportunity radar	Multi-source quotes, liquidity analytics, spread scanning and signal display
SONAX STRATEGYOS	Intelligent strategy hub	Multi-agent teamwork, backtesting, simulation and workflows
SONAX RISKSHIELD	Risk governance gateway	Authorization review, allowlists, exposure caps and circuit breakers
SONAX AGENTWALLET	Programmable finance account	Session permissions, isolated signing, asset views and reconciliation
SONAX AGENTHUB	Open services marketplace	Tool publishing, Agent calls, APIs, payments and settlement

Extended Service Capabilities

AgentPay | Machine Payments — Stablecoin payment protocols support procurement of data, compute capacity, financial APIs and inter-agent services, using spending limits, permissions and payment receipts for business settlement.

Institutional API | Enterprise Finance Tools — Order execution monitoring, transaction records, data access and risk-management APIs enable integration with enterprise systems.

Compute Services | Computing Resources — GPU compute supply, job scheduling and enterprise APIs provide service interfaces; GPU services and tokenized equity price exposure are managed separately.

CHAPTER 05

Multi-Agent Technical Architecture

SEVEN LAYER INFRASTRUCTURE

Layer	Components	Business Function
L7 · Application	User terminals, institutional consoles, marketplace	Unified strategy, asset and service views
L6 · Agent Coordination	Market Scout, Pricing, Strategy, Risk, Audit	Research, analysis and task orchestration
L5 · Data & Tools	RPC, order books, oracles, DEX pool states	Unified market data and tool calls
L4 · Policy & Risk	Policy Engine, allowlists, limits, circuit breakers	Authorization compliance per operation
L3 · Execution	Route search, simulation, status tracking	Executable orders and failed-order retries
L2 · Wallet & Settlement	Smart accounts, controlled signing, stablecoin payments	Permissions and final asset delivery
L1 · Infrastructure	Blockchains, nodes, audit logs	Computing, storage and verifiable records

Specialist Agent Responsibilities

Market Scout gathers cross-market data; Pricing calculates executable quotes and costs; Strategy manages candidate strategies; Risk checks permissions and exposure; Execution manages simulation and order status; Treasury tracks balances and inventory; Audit records realized net P&L and verifiable operation logs.

System Control Rule: AI models never hold private keys or change their own asset permissions. Independent components validate signatures and limits.

CHAPTER 06

On-Chain Arbitrage & Quantitative Strategies

ON-CHAIN OPPORTUNITY ENGINE

Strategy Type	Return / Efficiency Source	Execution Requirements
Same-chain DEX spreads	Executable differences across pools for the same asset	Depth, Gas and atomic-settlement routes
Same-chain triangular arbitrage	Circular mispricing across three trading pairs	Pool depth, slippage and contract constraints
Non-harmful post-event arbitrage	Rebalancing after public pool-state changes	Lawful ordering and non-harmful execution
Liquidity optimization	Fee capture and dynamic LP-position management	Impermanent loss, pool risk and rebalancing costs
Basis and controlled hedging	Spreads between spot and compliant derivatives	Eligible venues, margin and liquidation controls
Smart trade routing	Optimized routes and costs across markets	Real quotes, fill conditions and asset permissions

How Arbitrage Profit Is Generated

Actual net trading results equal realized spread revenue minus trading fees, Gas and priority fees, slippage and market impact, funding costs, and attributable failed-order costs. Before signing, the system revalidates quote freshness, target contracts, cost thresholds and available balances. Opportunities exceeding limits are removed from the execution queue.

Viable Opportunity = Executable Spread × Available Capacity × Cost Constraints × Authorization

Opportunity identification, fill quality and net-profit attribution constitute a complete institutional execution framework.

CHAPTER 07

Tokenized U.S. Equities Financial Services

TOKENIZED EQUITIES

Tokenized Equities and Their Underlying Securities

Tokenized U.S. equity products connect equity-price exposure to digital-asset networks through different legal structures. Issuers, product terms and trading venues determine holders' actual redemption, transfer and other rights. SONAX checks asset equivalence, trading permissions and executable market depth for each token structure.

Three Strategy Pathways

Cross-Market Spreads for Equivalent Tokens — Compare executable bid/ask quotes for equity tokens with identical legal rights and issuance structures across venues. Validate tradeable margins using fill capacity, fees on both sides and funding paths.

Reference-Price Deviation Monitoring — Normalize timestamps and corporate actions when comparing token quotes with underlying-equity reference prices. Identify deviations and risk exposures; convergence is not a guaranteed return.

Eligible Issuance/Redemption Arbitrage — Where issuance/redemption access and settlement paths exist, compare on-chain executable prices with actual mint/redeem consideration, net of channel charges and time costs.

Professional Boundaries for Market Execution

Regular U.S. trading hours, off-hours liquidity, token legal structure and account eligibility jointly determine strategy feasibility. SONAX manages permissions separately by venue and product; cross-chain transfers are not assumed to equal equity-token mint/redemption, nor are theoretical price deviations assumed to generate profits.

CHAPTER 08

Financial Execution Loop & Risk Framework

EXECUTION, POLICY & AUDIT

End-to-End Standard Execution Workflow

Step	System Action	Validation
01 Data Acquisition	Collect on-chain state and quotes	Timestamps and source consistency
02 Opportunity Detection	Filter eligible asset spreads	Equivalent rights, depth and amounts
03 Strategy Simulation	Replay fills, slippage and costs	Real capital capacity and failure costs
04 Risk Review	Check allowlists, limits and positions	Permissions, leverage, assets, accounts
05 Controlled Execution	Separate trading service submits orders	Isolated signing and idempotent retries
06 On-Chain Confirmation	Check filled assets and receipts	Finality and completion of both legs
07 Outcome Audit	Record costs, net P&L and exceptions	Traceability, reconciliation and review

Critical Security Controls

The platform applies account separation, revocable session permissions, contract allowlists, dynamic fee limits, exposure controls, transaction simulation, anomaly pauses and independent operation audits. For non-atomic cross-venue trades, the execution gateway reduces mismatched-leg risks through order limits, timeout cancellation, balance checks and failure handling.

CHAPTER 09

Business Revenue & Value Capture

BUSINESS MODEL

Separate Trading and Platform Accounts

SONAX combines real strategy outcomes with technology-service revenue. The trading layer records realized net profits and losses from proprietary capital or appropriately authorized accounts. The platform layer records contracted software subscriptions, institutional licenses, API usage fees and performance service fees permitted by applicable law and contract.

Revenue Category	Service Offering	Revenue Recognition
Strategy Performance	Restricted strategy management, execution and verification	Contracted fees on eligible realized net gains
Professional SaaS	Quote dashboards, strategy management, risk and reporting	Fees by feature and service term
Institutional Licensing	Dedicated deployment, strategy gateway, trade/risk APIs	Licenses, usage and technical support
Agent Marketplace	Data, risk, simulation and third-party tools	Paid calls and platform commissions
Machine Payment Services	Stablecoin settlement, accounting and reconciliation	API and enterprise technology charges

Drivers of Sustainable Growth

Unified risk and settlement APIs improve repeat-use efficiency. Professional data improves pricing and opportunity screening. Enterprise APIs and developer services broaden recurring revenue beyond trading. The platform prioritizes paying customers, net service gross margins, system reliability and audit quality.

For accounting purposes, trading turnover, user principal, TVL, protocol token releases and unrealized gains are not recognized platform revenue.

CHAPTER 10

SONAX Tokenomics

SONAX TOKENOMICS

SONAX is the official ecosystem token, with an initial supply of 10 billion tokens. An aggressive deflationary mechanism is designed to reduce circulating supply ultimately to 21 million, creating absolute scarcity. XXX/SONAX is the liquidity trading pair; SONAX supports protocol reward distributions, ecosystem incentives and community collaboration. Market value depends on actual transactions and liquidity; issuance and allocations do not constitute any price or return commitment.

Allocation	Share	SONAX Tokens	Ecosystem Function
Reward Mining Pool	95%	9.5 billion	LP rewards and protocol distributions
LP Liquidity Development	3%	300 million	Liquidity development and pool management
FOMO Incentive Pool	1%	100 million	Daily ranking rewards
Community Rewards	1%	100 million	Community contributions and collaboration

Trading Fee Mechanism

Transaction	Protocol Tax	Fund Allocation
Buy SONAX	0%	No project-side buy tax; network Gas and DEX fees apply
Sell SONAX	10%	3% burned + 2% returned to base pool + 5% marketing

SONAX trading taxes follow the deployed contract's definitions and tax base; burning, allocations and pool balances are visible on-chain.

CHAPTER 11

SONAX Global Foundation & Alpha XXX Strategy

GLOBAL FOUNDATION & Alpha XXX ECOSYSTEM

Global Governance & Resource Coordination

SONAX Global Foundation is organized around a U.S. legal entity and coordinates the global ecosystem in digital finance, Web3 communities, AI applications and blockchain innovation services. Foundation governance covers strategic planning, partner evaluation, material fund decisions, compliance processes and public disclosures. Institutional governance supports long-term SONAX product development and the XXX/SONAX ecosystem.

Implementation Path for the Alpha XXX Strategy

Phase	Work Items	Public-Facing Outcome
Project Assessment	Verify assets, trading markets, ownership and team governance	Alpha XXX opportunities and roadmap
Investment Transaction	Define assets, terms, consideration and rights	Capital collaboration framework
Ecosystem Co-Development	Support branding, developers, community and markets	Shared products and community operations

Boundaries of the Alpha Ecosystem Narrative

The Alpha XXX project pursues asset collaboration based on its visibility and trading foundation within the Binance Alpha ecosystem. Alpha listings, industry-account follows and community outreach are indicators of market visibility, not equivalent to spot-exchange listing, investment by the platform or an official commercial partnership. Public cooperation claims follow independently confirmed official announcements from both parties.

Three-Way Synergy: Capital, Technology & Markets

Capital collaboration supports governance and product development; agentic finance tools improve trading experience and management efficiency; community co-creation and international business development create market entry points. SONAX continues to connect these capabilities through the XXX/SONAX trading pair and ecosystem services.

CHAPTER 11 / GLOBAL FOUNDATION

SONAX Global Foundation | Global Strategy & Governance

U.S. ENTITY · GLOBAL GOVERNANCE · WEB3 + AI ECOSYSTEM

U.S. Legal Entity & Ecosystem Governance

SONAX Global Foundation uses a U.S. legal entity as its organizational basis. It establishes governance and resource coordination around digital finance, Web3 ecosystems, AI agents and global blockchain applications. The foundation unifies products, protocols, communities and commercial partnerships under one strategic framework, connecting regional participants through defined decision-making and disclosure mechanisms.

Governance Area	Responsibilities and Implementation
Strategic Governance	Coordinate ecosystem direction, product roadmaps and key project reviews; define tiered decisions and accountability
Financial Compliance	Apply entity registrations, AML/KYC, risk management and securities-financing procedures by region and activity
Fund Management	Separate approval rights for budgets, partner costs, protocol funds and corporate funds
International Cooperation	Coordinate technical partnerships, communities, business development and global market services

Strategic Investment & Alpha XXX Ecosystem Integration

SONAX Global Foundation conducts value research and strategic cooperation concerning Alpha XXX, a project featured within the Binance Alpha ecosystem. Priority areas include asset fundamentals, ecosystem technology, community networks, brand development and global expansion. Investment and cooperation are implemented through valid transaction documents, closing arrangements and formal confirmations by both parties.

Development Stage	Key Tasks
Project Research	Evaluate asset structures, on-chain trading, technology, partnership terms and operating compliance
Strategic Investment	Define investment assets, transaction structure, governance, funding and closing terms
Business Synergy	Connect agentic financial tools, XXX/SONAX liquidity, R&D and global communities
Public Disclosure	Announce material progress formally, with a clear scope of cooperation

SONAX GLOBAL FOUNDATION · CAPITAL COLLABORATION · ECOSYSTEM BUILDING

CHAPTER 11 / U.S. COMPLIANCE

U.S. Entity Registration & Compliance Framework

CORPORATE STATUS · FINCEN MSB · SEC REGULATION D

SONAX's U.S. business architecture combines entity registration, applicable money-service regulations and securities issuance rules. These cover corporate identity, payments and funds services, capital raising and risk disclosure. Each document serves a distinct legal function, and operating qualifications and scope must be assessed separately.

Module	Function and Legal Boundaries
U.S. Foundation Entity	SONAX Global Foundation uses U.S. entity-registration records for governance and business organization; its status and powers depend on the relevant records.
FinCEN MSB Registration	The U.S. Treasury financial-crime enforcement framework imposes applicable AML, identification and reporting duties; registration is not a state license.
SEC Regulation D	A U.S. private securities offering exemption regime covering offering terms, investor eligibility, documents and Form D notices; not SEC approval.

Compliance Principle: entity registration, MSB registration and Regulation D private-offering rules serve separate purposes. None constitutes a government guarantee of SONAX investment returns, product safety or trading strategies. Securities, payments, custody, trade execution and asset management activities are subject to the rules applicable to the actual services performed.

CHAPTER 12

User Growth & Global Commercial Expansion

GO-TO-MARKET

Two-Sided Market: Users and Enterprises

Individual Ecosystem Participants — Join through XXX/SONAX LP, token benefits, strategy data services and community governance interfaces, with access to protocol rules and account status.

Quant Researchers and Strategy Teams — Integrate trading systems through APIs, price monitoring, trade simulation, risk rules and execution logs.

Ecosystem Projects and Developers — Publish market data, models, audit tools and financial services via AgentHub, using controlled payment infrastructure for billing.

Institutions and DAO Treasuries — Automate finance through funding permissions, trading approvals, asset monitoring, reconciliation and system APIs.

Content Outreach & Community Operations

Ecosystem communications center on agentic technology, on-chain arbitrage execution, transparent XXX/SONAX rules, product capabilities and community development. Market content emphasizes real trading data, verifiable mechanisms and accessible explanations, combining technology demonstrations, strategy education, event operations and long-term partnerships.

CHAPTER 13

Development Roadmap & Delivery Framework

ECOSYSTEM ROADMAP

Phase	Core Development	Key Deliverables
PHASE 01 · Core Engine	Market data, multi-agent analysis, strategy backtesting and contract risk control	Market dashboard, risk policies, protocol accounts
PHASE 02 · Trading & Ecosystem	Same-chain execution, XXX/SONAX LP, distributions and user portal	Execution records, protocol user pages, asset reconciliation
PHASE 03 · Product Expansion	Institutional APIs, stablecoin payments, quantitative portfolios and compute interfaces	Institutional workflows, service billing, risk reports
PHASE 04 · Open Agent Network	AgentHub, open tools, identity and cross-agent services	Developer marketplace, open protocols, business settlement

Development Principles

Every phase prioritizes verifiable feature delivery, system reliability, asset control and genuine user needs. Product releases and partnerships follow business readiness, technical security and applicable compliance processes, with sustainable long-term service capability as the objective.

CHAPTER 14

Operating Metrics & Business Management

OPERATING SYSTEM

Operating Area	Key Metrics	Management Purpose
Trading Strategies	Execution-fill rate, realized net edge, drawdown, failure costs	Validate effectiveness and risk tolerance
Data & Systems	Quote freshness, API uptime, task latency	Ensure system availability
Fund Management	Account balances, inventory drift, irregular transfers	Protect asset control and audit consistency
Platform Revenue	Paying accounts, enterprise renewals, service gross margin	Monitor actual revenue quality
Ecosystem Protocol	LP volume, releases, redemptions and tax flows	Keep token accounting transparent
Community Activity	Qualified members, participation and retention	Measure community activity and demand

Three Separate Ledgers for Revenue & Rewards

The platform operating ledger records recognizable subscriptions, licenses and technology-service revenue with related costs. The trading strategy ledger tracks realized net P&L after actual fills. The ecosystem protocol ledger tracks SONAX distributions, tax burns, Alpha XXX project consumption, LP positions and incentive pool balances. All three are reconciled, disclosed and audited separately; token releases are not treated as operating profit.

Operating Organization

Functions include product engineering, agent R&D, quantitative trading engineering, smart contract security, risk and compliance, treasury and finance, institutional business development and community operations. Strategy configuration is separated from fund approvals; contract upgrades are separated from security approvals.

CHAPTER 15

Compliance Governance & Risk Framework

GOVERNANCE & RISK

Cross-Market Operating Requirements

The platform fulfills applicable obligations for digital asset trading, payments, custody, investment advice, securities and derivatives according to jurisdiction, business type and control of funds. U.S. money-services activities require FinCEN MSB registration and AML/KYC controls where applicable, with separate review of relevant state licenses. Eligible private securities financing follows Regulation D and Form D filing requirements. Entity registration, MSB registration and securities exemption filings do not establish government approval of investment returns, strategies or product safety.

Protocol & Trading Risks

Market Risk — Price swings, liquidity shortages and competition may erase spreads or cause account losses.

Technology Risk — Contract flaws, RPC outages, wallet-signing errors and third-party failures may disrupt execution.

Protocol Distribution Risk — SONAX release rates, 4× release limits and auto-compounding are contract-quantity rules. Token market value, realizability and redemption proceeds are not guaranteed.

Asset Rights Risk — Equity tokens differ in legal rights, access eligibility and redemption conditions.

Incentive Structure Risk — Referral rewards, team tiers and pool allocations must comply with local rules on marketing, financial products and multilevel incentives.

Transparent Operating Principles

The platform supports long-term operations through clear account permissions, audit logs, risk limits, fee disclosures and exception-handling policies. It prohibits promises of fixed returns, capital protection, regulatory approval or unverified partnerships. Users must understand trading and protocol risks and independently bear market risk.

CHAPTER 16

Future Vision & Strategic Summary

AIFi FINANCIAL ECOSYSTEM

SONAX advances digital-asset finance beyond isolated trading tools toward an open multi-agent collaboration system. Market intelligence, strategy execution, payments, settlement and asset management connect through programmable infrastructure. The XXX/SONAX ecosystem provides liquidity participation and user collaboration, forming a long-term network of professional financial tools, ecosystem protocols and global communities.

Long-Term Strategic Priorities

Networked Financial Tools — Open APIs and professional agents lower integration costs for financial products.

Professional Trade Execution — Quality data, disciplined risk control and transparent P&L improve automation.

Transparent Protocol Ecosystem — On-chain accounts and traceable actions organize XXX/SONAX incentives and circulation.

Global Commercial Collaboration — Connect developers, enterprise providers, communities and qualified asset infrastructure.

SONAX | Aggregating On-Chain Opportunities. Powering Intelligent Execution.

Every opportunity, strategy decision and financial settlement can be independently traced.

SONAX · AGENTIC FINANCE INFRASTRUCTURE
